

Forklift Fork Positioners

Forklift Fork Positioner - The fork positioner is a hydraulic apparatus that allows the person driving to be able to maneuver the lift truck without leaving the seat. They are constructed out of top quality materials and are meant to withstand the most difficult procedures and work environments. Side shifting units have the extra ability to be able to laterally position the entire load or the arms so as to facilitate more exact carrying and placement in a quicker and more effective method.

The fork pocket is somewhat unique and can enable the individual operating it to be able to safely sway the forks into position without any worry of destroying the positioning cylinders. This can allow the driver the choice to be able to execute simultaneous or independent fork movement, depending on the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are needed. Standard OEM carriages could be transformed into fork positioners on available units.
